Score_processor.py

```
class ScoreProcessor:

    def process_score_file(self, file_path: str) -> int:

        try:
            with open(file_path, "r") as file:
                content = file.read().strip()

                score = int(content)

                result = score * 10

        except FileNotFoundError:
            print("Error: File not found.")
            raise

        except ValueError:
            print("Error: Invalid number format in file.")
            raise

        else:
            print("Data processed successfully")
```

```
        return result

    finally:
        print("File cleanup completed")
```

test_score_processor.py

```
import pytest
from score_processor import ScoreProcessor

@pytest.fixture
def processor():
    return ScoreProcessor()

def test_successful_score_processing(processor, tmp_path):

    # Create temporary valid file
    test_file = tmp_path / "score.txt"
    test_file.write_text("5")

    result = processor.process_score_file(str(test_file))

    assert result == 50

def test_missing_file(processor):

    with pytest.raises(FileNotFoundError):
        processor.process_score_file("missing_file.txt")
```

```
def test_invalid_number_format(processor, tmp_path):

    # Create temporary invalid file
    test_file = tmp_path / "invalid.txt"
    test_file.write_text("abc")

    with pytest.raises(ValueError):
        processor.process_score_file(str(test_file))
```
